

**PANEL TESTIMONY OF VERIZON - MASSACHUSETTS ON
COSTS AND RATES FOR UNBUNDLED NETWORK
ELEMENTS AND RELATED WHOLESALE SERVICES**

1 determined?

2 A. The same utilization for Digital Loop Carrier lines at the RT was
3 used for the switch digital line ports.

4 Q. How was the forward-looking utilization for analog line ports
5 determined?

6 A. The utilization of analog lines is set at 93 percent.

7 Q. Does the SCIS model allow for administrative fill in its cost
8 calculation?

9 A. Yes. SCIS has an input to allow for administrative spare for trunks
10 and lines. In Verizon MA's study, the administrative spare capacity
11 fills used are: digital trunk ports - 95 percent; digital line ports - 93
12 percent; and analog line ports - 95 percent.

13 Q. Does SCIS allow for breakage in its cost calculation?

14 A. Yes. SCIS adds one half of the cost of a line (or trunk) unit peripheral
15 when it calculates the total cost of lines (and trunks).

16 Q. Did Verizon MA adjust the overall utilizations described above to
17 account for SCIS treatment of administrative fill and breakage?

18 A. Yes. The utilizations for digital trunk ports, digital line ports, and
19 analog line ports were adjusted for SCIS administrative fills and
20 breakage for each office.

**PANEL TESTIMONY OF VERIZON - MASSACHUSETTS ON
COSTS AND RATES FOR UNBUNDLED NETWORK
ELEMENTS AND RELATED WHOLESALE SERVICES**

1 **4. Switch Ports**

2 Q. How were material investments converted to the port material
3 investments?

4 A. Unit material investments for the Line and Trunk port components
5 were obtained directly from the SCIS model office outputs, then
6 adjusted as described above. Unit material investments were
7 developed for analog line, digital line, Basic Rate ISDN ("ISDN BRI"),
8 and coin line ports, and for digital and Primary Rate ISDN ("ISDN –
9 PRI") trunk ports. The material investment associated with the Trunk
10 Port was expressed on a per-port (Dedicated) basis and an all hours
11 of the day ("AHD")³⁴ per-minute-of-use ("MOU") (Common) basis.

12 Q. Why was the Trunk Port cost calculated on both a per-port basis and
13 an AHD-MOU basis?

14 A. The Trunk Port was calculated on a per-trunk basis for those carriers
15 who wish to purchase dedicated trunk ports. The Trunk Port was
16 calculated on an AHD-MOU basis for those carriers who simply
17 purchase switching on a per-minute basis (*i.e.*, through the UNE

³⁴ "All Hours of the Day" means averaged over all time-of-day periods.

**PANEL TESTIMONY OF VERIZON - MASSACHUSETTS ON
COSTS AND RATES FOR UNBUNDLED NETWORK
ELEMENTS AND RELATED WHOLESALE SERVICES**

1 Platform).

2 Q. How were the material investments associated with trunk ports
3 converted to a per-MOU basis?

4 A. The MOU trunk port cost was derived by dividing the trunk port
5 investment by the designed busy-hour minutes of use capacity of the
6 trunk port. The busy-hour investment was then converted to an AHD
7 investment by the application of the annual-to-busy-hour ratio.

8 Q. How were the investments associated with coin ports developed?

9 A. Incremental investments associated with coin ports was determined
10 from SCIS.

11 **5. Usage**

12 Q. How were material investments converted to Local Switch Usage
13 material investment?

14 A. Total material investment for the Line and Trunk Port components
15 from the SCIS model office outputs was subtracted from the total
16 SCIS investment to arrive at a total switch usage investment. This
17 investment (usage) represents all switch investment, without the
18 Trunk Port and Line Port investments, and includes features.

19 Q. How was the material investment associated with usage converted to
20 a MOU basis?

**PANEL TESTIMONY OF VERIZON - MASSACHUSETTS ON
COSTS AND RATES FOR UNBUNDLED NETWORK
ELEMENTS AND RELATED WHOLESALE SERVICES**

1 A. The usage investment was divided by the busy hour total switch MOU
2 capacity (at the planning cycle midpoint) to arrive at a busy hour
3 MOU investment for Usage.

4 Q. How was the total investment per busy hour MOU converted to a cost
5 per AHD MOU?

6 A. The total investment per busy hour MOU was converted to a total cost
7 per busy hour MOU by the application of annual cost factors and
8 investment related loadings as previously described in this testimony.
9 This total was converted to an AHD MOU cost by the application of
10 the busy hour to AHD conversion factor.

11 Q. Are the Local Switching Usage originating and terminating MOU costs
12 that Verizon MA is proposing applicable to both intra- and inter-switch
13 calls?

14 A. Yes. The entire capacity of MOU (originating minutes *plus*
15 terminating minutes) was use to develop the per-MOU costs of Local
16 Switch Usage. The costs associated with a terminating MOU is the
17 same cost for a terminating MOU for any call type (intra-switch or
18 inter-switch). Likewise, the cost associated with an originating MOU
19 is the same cost for originating MOU for any type of call (intra-switch
20 or inter-switch).

**PANEL TESTIMONY OF VERIZON - MASSACHUSETTS ON
COSTS AND RATES FOR UNBUNDLED NETWORK
ELEMENTS AND RELATED WHOLESALE SERVICES**

1 Q. Is Verizon MA proposing to charge the originating usage rate for all
2 originating minutes, and the terminating usage rate for all terminating
3 minutes?

4 A. Yes. Verizon MA separated its total switching usage costs into
5 terminating and originating costs.

6 Q. Please explain non-conversation time ("NCT") and how it relates to
7 usage costs.

8 A. Conversation time is the actual time (in MOU) that switch resources
9 are being used during the conversation part of each call. Non-
10 conversation time represents the time that switch resources are being
11 used other than during the actual conversation time. For example,
12 NCT includes the time required for dialing the call, ringing, and call
13 set-up. It also includes the time associated with calls that are not
14 completed (that is, the called party does not answer). Since non-
15 conversation times are not measured by the switches billing
16 recordings, and thus cannot be billed, NCT must be added to the
17 conversation minutes (MOU's) to account for these times.

18 Q. Please explain how RTU was included in Local Switching Usage?

19 A. The right-to-use factor was applied against the total in-place MOU
20 busy hour investment to arrive at a right-to-use cost per busy hour

**PANEL TESTIMONY OF VERIZON - MASSACHUSETTS ON
COSTS AND RATES FOR UNBUNDLED NETWORK
ELEMENTS AND RELATED WHOLESALE SERVICES**

1 MOU. This cost was then added to the switch busy hour MOU usage
2 cost to arrive at a total busy hour MOU cost for local switch usage.

3 **a) Reciprocal Compensation Usage**
4 **(Terminating)**

5 Q. Please explain why the Company is filing a separate usage
6 (terminating) cost for Reciprocal Compensation.

7 A. Section 251 (b)(5) of the Act states that all Local Exchange Carriers
8 have "the duty to establish reciprocal compensation arrangements for
9 the transport and termination of telecommunications." Reciprocal
10 compensation arrangements include the mutual and reciprocal
11 recovery of costs through cash payments or other non-cash
12 transactions such as bill-and-keep arrangements. Additionally,
13 incumbent local exchange carriers are obligated to provide
14 interconnection "on rates, terms, and conditions that are just,
15 reasonable, and nondiscriminatory."³⁵ In Section 252(d)(2)(A), the Act
16 specifies that a state Commission can not consider the terms and
17 conditions to be just and reasonable unless -,
18 i. Such terms and conditions provide for the mutual and reciprocal

³⁵ Telecommunications Act of 1996 at SEC. 251 (c)(2)(D)

**PANEL TESTIMONY OF VERIZON - MASSACHUSETTS ON
COSTS AND RATES FOR UNBUNDLED NETWORK
ELEMENTS AND RELATED WHOLESALE SERVICES**

1 recovery by each carrier of costs associated with the transport and
2 termination on each carrier's network, facilities of calls that originate
3 on the network facilities of the other carrier; and

4 ii. Such terms and conditions determine such costs on the basis of a
5 reasonable approximation of the *additional costs* of terminating such
6 calls.

7 Therefore, the Company has appropriately filed costs associated with
8 the *additional costs* of terminating such calls..

9 Q. Please explain how the Reciprocal Compensation usage cost was
10 developed.

11 A. The additional costs associated with basic usage type calls (no-
12 features) were determined in the same manner as previously
13 described for Local Switch Usage, however the getting started³⁶
14 investments identified by SCIS, and RTUs were excluded.

15 **6. Port Additives**

16 Q. How were the investments associated with the "port additives"

³⁶ "Getting started" investments represent the investments associated with switch processor and memory, and are not impacted by the additional reciprocal compensation usage.

**PANEL TESTIMONY OF VERIZON - MASSACHUSETTS ON
COSTS AND RATES FOR UNBUNDLED NETWORK
ELEMENTS AND RELATED WHOLESALE SERVICES**

1 developed?

2 A. The incremental hardware investments associated with optional
3 features was determined by running each feature through SCIS/IN.
4 SCIS/IN is the module of SCIS that calculates incremental
5 investments associated with specific features of the switch. When
6 Telcordia releases a new version of SCIS/MO, it also releases a new
7 version of SCIS/IN to run in conjunction with it. Verizon MA used
8 Version 2.8 of SCIS/IN in conjunction with SCIS/MO Version 2.8.

9 Q. How were the material investments described above converted to in-
10 place investments?

11 A. The material investments were converted to total in-place investments
12 by the use of loading factors for power, EF&I, and L&B as previously
13 described.

14 **7. Deaveraging**

15 Q. Should Local Switching rates be deaveraged?

16 A. No. Differences in local switching rates between zones could lead to
17 asymmetric inter-zone usage rates. Calls originating from point A and
18 terminating at point B might wind up being rated differently than calls
19 originating from point B and terminating at point A. This is an
20 undesirable result and proposes statewide local usage rates to guard

**PANEL TESTIMONY OF VERIZON - MASSACHUSETTS ON
COSTS AND RATES FOR UNBUNDLED NETWORK
ELEMENTS AND RELATED WHOLESALE SERVICES**

1 against this possibility.

2 **D. TANDEM SWITCHING**

3 **1. Element Description**

4 Q. What is the tandem switching element?

5 A. Tandem switching is defined as follows in FCC Rule 319(c)(2).

6 Local Tandem Switching Capability. The tandem switching capability
7 network element is defined as:

8 (A) Trunk-connect facilities, which include, but are not limited to, the
9 connection between trunk termination at a cross connect panel and
10 switch trunk card;

11 (B) The basic switch trunk function of connecting trunks to trunks; and

12 (C) The functions that are centralized in tandem switches (as
13 distinguished from separate end office switches), including but not
14 limited, to call recording, the routing of calls to operator services, and
15 signaling conversion features.

16 Q. Please define the tandem switching element used in Verizon MA's
17 forward-looking incremental cost study.

18 A. The tandem switching element used in the Company's cost study

**PANEL TESTIMONY OF VERIZON - MASSACHUSETTS ON
COSTS AND RATES FOR UNBUNDLED NETWORK
ELEMENTS AND RELATED WHOLESALE SERVICES**

1 consists of trunk ports (digital) and usage. Trunk ports are either
2 dedicated or common. Common trunk ports are recovered on a per
3 minute-of-use basis.

4 **2. Technology Assumptions**

5 Q. Please describe the forward-looking tandem switch construct.

6 A. The forward-looking tandem switch construct is based on the latest
7 available tandem digital switching with a mix of 5ESS (82.90
8 percent) and DMS-200 (17.10 percent) technologies based on the
9 number of trunks, placed at current tandem locations.

10 Q. Please describe in detail how the construct was designed.

11 A. Existing office parameters, adjusted to make them forward-looking,
12 were provided by Verizon MA's engineering organization for each
13 existing tandem switch in Massachusetts, and were used to create
14 SCIS model offices for both DMS-200 and 5ESS technology. SCIS
15 then calculated, by switch technology type, unit and total switch
16 material investments for both technologies.

17 Q. Please describe how the tandems were adjusted to make them forward-
18 looking.

19 A. Tandem switches were adjusted in the same manner as previously
20 described for Local Switching.

**PANEL TESTIMONY OF VERIZON - MASSACHUSETTS ON
COSTS AND RATES FOR UNBUNDLED NETWORK
ELEMENTS AND RELATED WHOLESALE SERVICES**

1 **3. General Costing Approach**

2 Q. Please describe the cost methodology used in developing the
3 Tandem Switching element.

4 A. The cost methodology used in developing the Tandem switching
5 costs is consistent with the cost methodology described above for
6 local switching.

7 Q. Did the Company deaverage the Tandem Switching element by
8 zone?

9 A. No. Since tandem switching will provide delivery of calls between two
10 (or more) density zones, it would not be meaningful to develop
11 deaveraged tandem switching costs.

12 Q. How were the material investments for the tandem developed?

13 A. The material investments for the tandem were developed using SCIS,
14 in the same manner described for Local Switching. However the
15 feature module of SCIS was not required because trunk features are
16 provided solely by software and the processor.

17 Q. Please explain how RTU was included in Tandem Switching?

18 A. RTU was included in Tandem Switching in the same manner as
19 previously described for Local Switching.

**PANEL TESTIMONY OF VERIZON - MASSACHUSETTS ON
COSTS AND RATES FOR UNBUNDLED NETWORK
ELEMENTS AND RELATED WHOLESALE SERVICES**

1 **E. TOPS SWITCHES**

2 Q. What is a "TOPS" switch?

3 A. A TOPS ("Telephone Operator Position System") switch is the switch
4 type utilized for routing Operator Services calls in Verizon MA's
5 network. A TOPS switch is a type of tandem switch.

6 Q. What cost elements has the Company identified for access to TOPS
7 switches?

8 A. The Company has identified the investment and associated cost for a
9 DS1 level trunk termination. The cost associated with the trunk
10 termination has been developed on a per trunk basis for dedicated
11 trunks, as well as a per MOU for common trunks.

12 Q. Please define the TOPS trunk port element used in Verizon MA's
13 study.

14 A. The TOPS trunk port element used in the Company's cost study
15 consists of digital DS1 trunk ports. Trunk ports can be either
16 dedicated or common. Costs of common trunk ports are recovered on
17 a per minute of use basis; costs of dedicated trunk ports are
18 recovered on a monthly recurring basis.

19 Q. Please describe the forward-looking TOPS switch construct.

20 A. The forward-looking TOPS switch construct is based on the latest

**PANEL TESTIMONY OF VERIZON - MASSACHUSETTS ON
COSTS AND RATES FOR UNBUNDLED NETWORK
ELEMENTS AND RELATED WHOLESALE SERVICES**

1 available TOPS digital switching, which is DMS-200 technology ,
2 placed at current TOPS locations.

3 Q. Please describe in detail how the construct was designed.

4 A. The forward-looking DMS-200 TOPS switches were developed by
5 reviewing all of Verizon MA's TOPS switches in Massachusetts, and
6 adjusting them to make them forward-looking in the same manner
7 previously described for Local Switching. The forward-looking offices
8 were then used as the basis for determining the investments
9 associated with the TOPS Switching element.

10 Q. Please describe the cost methodology used to develop the TOPS
11 trunk port cost.

12 A. The cost methodology used to develop the TOPS port cost is
13 consistent with the cost methodology described for the Local
14 Switching trunk port cost above.

15 Q. Did the Company deaverage the TOPS trunk port element by zone?

16 A. No. Like tandems, TOPS will provide delivery of calls between two
17 (or more) density zones. It is thus not meaningful to develop
18 deaveraged TOPS trunk port costs.

19 Q. How were the material investments for the TOPS developed?

20 A. The material investments for the TOPS were developed using SCIS,

**PANEL TESTIMONY OF VERIZON - MASSACHUSETTS ON
COSTS AND RATES FOR UNBUNDLED NETWORK
ELEMENTS AND RELATED WHOLESALE SERVICES**

1 in the same manner described for Local Switching. However the
2 feature module of SCIS was not required because trunk features are
3 provided solely by software and the processor.

4 Q. Please explain how RTU was included in TOPS Switching?

5 A. RTU was included in TOPS Switching in the same manner as
6 previously described for Local Switching.

7 **IX. INTEROFFICE TRANSPORT**

8 Q. Please describe the Interoffice Transport (or "IOF"³⁷) element.

9 A. The element is defined as follows in FCC Rule 319(d).

10 Interoffice Transmission Facilities. An incumbent LEC shall
11 provide nondiscriminatory access, in accordance with § 51.311
12 and section 251(c)(3) of the Act, to interoffice transmission
13 facilities on an unbundled basis to any requesting
14 telecommunications carrier for the provision of a
15 telecommunications service.

16 (1) Interoffice transmission facility network elements
17 include:

18 (A) Dedicated transport, defined as incumbent LEC
19 transmission facilities, including all technically
20 feasible capacity-related services including, but
21 not limited to, DS1, DS3 and OCn levels,
22 dedicated to a particular customer or carrier, that
23 provide telecommunications between wire

³⁷ "IOF" stands for Interoffice Facilities.

**PANEL TESTIMONY OF VERIZON - MASSACHUSETTS ON
COSTS AND RATES FOR UNBUNDLED NETWORK
ELEMENTS AND RELATED WHOLESALE SERVICES**

1 centers owned by incumbent LECs or requesting
2 telecommunications carriers, or between
3 switches owned by incumbent LECs or
4 requesting telecommunications carriers;

5 (B) Dark fiber transport, defined as incumbent LEC
6 optical transmission facilities without attached
7 multiplexing, aggregation or other electronics;

8 (C) Shared transport, defined as transmission
9 facilities shared by more than one carrier,
10 including the incumbent LEC, between end office
11 switches, between end office switches and
12 tandem switches, and between tandem switches,
13 in the incumbent LEC network.

14 **A. DEDICATED TRANSPORT**

15 **1. Element Description**

16 Q. Please define the Dedicated Interoffice Transport element used in
17 Verizon MA's forward-looking incremental cost study.

18 A. The Dedicated IOF element is defined as IOF transmission facilities
19 dedicated to a particular customer. Dedicated IOF is offered between
20 Verizon MA owned wire centers at the following signaling levels:
21 DS0, DS1, DS3, STS-1, OC-3, OC-12, and OC-48. Monthly costs
22 have been developed on a "fixed" basis and a "per mile" basis for
23 each signaling level facility.

24 Q. In general, what are the fixed (non-mileage-sensitive) costs of
25 dedicated transport?

**PANEL TESTIMONY OF VERIZON - MASSACHUSETTS ON
COSTS AND RATES FOR UNBUNDLED NETWORK
ELEMENTS AND RELATED WHOLESALE SERVICES**

1 A. The fixed investments are those investments identified at the
2 originating and terminating Verizon MA wire centers, which include
3 electronic equipment such as SONET add/drop multiplexers, digital
4 cross connect systems ("DCS"), and fiber terminations.

5 Q. In general, what are the per-mile costs of dedicated transport?

6 A. The variable investments are those investments which vary with the
7 length of the facility and contain interoffice fiber cables, structure, and
8 any electronics at intermediate Verizon MA serving wire centers.

9 **2. Technology Assumptions**

10 Q. Please describe the forward-looking IOF construct used as the basis
11 for developing the costs associated with Dedicated IOF Transport.

12 A. Verizon MA is using SONET fiber optic transport rings for growth
13 applications in the interoffice network. The IOF Transport cost
14 studies have been based on facility models, which are schematics
15 representing equipment routing and configurations using this
16 construct. The facility models were created to serve signal levels
17 (DS0, DS1, DS3, STS-1, OC-3, OC-12, and OC-48) throughout the
18 Verizon MA IOF network.

**PANEL TESTIMONY OF VERIZON - MASSACHUSETTS ON
COSTS AND RATES FOR UNBUNDLED NETWORK
ELEMENTS AND RELATED WHOLESALE SERVICES**

1 The model also identifies three types of SONET ring arrangements,
2 based on the complexity (high, medium, and low) of the IOF
3 configuration being served.

4 **3. Utilization**

5 Q. How is utilization accounted for in the transport study?

6 A. Consistent with the definition used throughout these studies,
7 utilization is accounted for as a percent of total installed capacity.
8 Interoffice transport elements (DS0, DS1, DS3, etc) must pass
9 through one or more levels of multiplexing to be carried by the
10 backbone transport network. As is the case with all network capacity,
11 the interoffice facility multiplexing equipment, including electronic
12 digital cross connect machines, cannot be operated at 100 percent of
13 capacity. A reasonable utilization level must be estimated for these
14 elements. The factors of rapid interoffice facility growth, churn,
15 equipment breakage, and administrative spare must all be reflected in
16 the utilization level. The combined impact of these factors yields an
17 estimated forward looking fill of 75 percent. This 75 percent
18 utilization factor is applied in the study at each multiplexing level in
19 the IOF model.

**PANEL TESTIMONY OF VERIZON - MASSACHUSETTS ON
COSTS AND RATES FOR UNBUNDLED NETWORK
ELEMENTS AND RELATED WHOLESALE SERVICES**

1 **4. Costing Approach**

2 Q. Describe how the investments for Dedicated IOF Transport were
3 developed.

4 A. IOF investments were developed on a fixed and variable basis. The
5 fixed investments, which were identified at the originating and
6 terminating Verizon MA serving wire centers, include electronic
7 equipment such as SONET Add/Drop Multiplexers, digital cross
8 connect frames, and fiber termination frames. The variable
9 investments, which were developed on a per-mile basis, are those
10 that vary with the length of the facility and contain the interoffice fiber
11 cable, structure, and any electronics necessary at intermediate
12 Verizon MA serving wire centers.

13 Q. Were structure investments included in the IOF study?

14 A. Yes. Outside plant interoffice structure investments were determined
15 using the same methodology as previously described to determine
16 loop structure investments.

17 Q. On what basis were the material and installation prices determined for
18 IOF?

19 A. Material prices for electronic equipment and cables reflect the latest
20 negotiated contract prices Verizon MA has with the manufacturers of

**PANEL TESTIMONY OF VERIZON - MASSACHUSETTS ON
COSTS AND RATES FOR UNBUNDLED NETWORK
ELEMENTS AND RELATED WHOLESALE SERVICES**

1 the circuit equipment and interoffice cable facilities. Circuit
2 equipment investment loading factors were multiplied by the material
3 prices to arrive at a total investment. Fiber cable installation and
4 engineering costs were obtained from ECRIS.

5 Q. Did the Company's cost study deaverage the Dedicated IOF
6 Transport investments by density zones?

7 A. No. Neither the "fixed or "variable" cost components are density
8 sensitive. Since an unbundled Dedicated IOF Transport facility can
9 originate and terminate in different density zones (as well as pass
10 through different central office nodes along the SONET rings), it is
11 not appropriate to deaverage the dedicated transport costs.

12 **B. COMMON TRANSPORT**

13 Q. Please define the Common Interoffice Transport element used in
14 Verizon MA's forward-looking incremental cost study.

15 A. The Common IOF element is defined as IOF transmission facilities
16 shared by more than one customer or carrier. Common IOF is offered
17 between Verizon MA owned wire centers on an MOU basis.

18 Q. Please describe how the MOU cost was developed for the Common
19 IOF Transport element.

**PANEL TESTIMONY OF VERIZON - MASSACHUSETTS ON
COSTS AND RATES FOR UNBUNDLED NETWORK
ELEMENTS AND RELATED WHOLESALE SERVICES**

1 A. The MOU cost for Common IOF Transport was developed by dividing
2 the Dedicated Transport investments by the capacity of annual
3 minutes of usage that could be transported by those investments.
4 This is a reasonable approach because Common Transport uses the
5 same physical interoffice facilities as Dedicated Transport.

6

7 **X. SIGNALING SYSTEMS AND CALL-RELATED DATABASES**

8 Q. Please describe the signaling system and call-related databases
9 element.

10 A. The element is described in FCC Rule 319(e) as follows:

11 Signaling Networks and Call-Related Databases. An
12 incumbent LEC shall provide nondiscriminatory access, in
13 accordance with § 51.311 and section 251(c)(3) of the Act, to
14 signaling networks, call-related databases, and service
15 management systems on an unbundled basis to any
16 requesting telecommunications carrier for the provision of a
17 telecommunications service.

18 (1) Signaling Networks: Signaling networks include, but are
19 not limited to, signaling links and signaling transfer
20 points.

21 (A) When a requesting telecommunications carrier
22 purchases unbundled switching capability from
23 an incumbent LEC, the incumbent LEC shall
24 provide access from that switch in the same
25 manner in which it obtains such access itself.

26 (B) An incumbent LEC shall provide a requesting
27 telecommunications carrier with its own switching

**PANEL TESTIMONY OF VERIZON - MASSACHUSETTS ON
COSTS AND RATES FOR UNBUNDLED NETWORK
ELEMENTS AND RELATED WHOLESALE SERVICES**

1 facilities access to the incumbent LEC's signaling
2 network for each of the requesting
3 telecommunications carrier's switches. This
4 connection shall be made in the same manner as
5 an incumbent LEC connects one of its own
6 switches to a signaling transfer point.

7 (2) Call-Related Databases: Call-related databases are
8 defined as databases, other than operations support
9 systems, that are used in signaling networks for billing
10 and collection, or the transmission, routing, or other
11 provision of a telecommunications service.

12 (A) For purposes of switch query and database
13 response through a signaling network, an
14 incumbent LEC shall provide access to its call-
15 related databases, including but not limited to,
16 the Calling Name Database, 911 Database, E911
17 Database, Line Information Database, Toll Free
18 Calling Database, Advanced Intelligent Network
19 Databases, and downstream number portability
20 databases by means of physical access at the
21 signaling transfer point linked to the unbundled
22 databases.

23 (B) Notwithstanding the incumbent LEC's general
24 duty to unbundle call-related databases, an
25 incumbent LEC shall not be required to unbundle
26 the services created in the AIN platform and
27 architecture that qualify for proprietary treatment.

28 (C) An incumbent LEC shall allow a requesting
29 telecommunications carrier that has purchased
30 an incumbent LEC's local switching capability to
31 use the incumbent LEC's service control point
32 element in the same manner, and via the same
33 signaling links, as the incumbent LEC itself.

34 (D) An incumbent LEC shall allow a requesting
35 telecommunications carrier that has deployed its

**PANEL TESTIMONY OF VERIZON - MASSACHUSETTS ON
COSTS AND RATES FOR UNBUNDLED NETWORK
ELEMENTS AND RELATED WHOLESALE SERVICES**

1 own switch, and has linked that switch to an
2 incumbent LEC's signaling system, to gain
3 access to the incumbent LEC's service control
4 point in a manner that allows the requesting
5 carrier to provide any call-related database-
6 supported services to customers served by the
7 requesting telecommunications carrier's switch.

8 (E) An incumbent LEC shall provide a requesting
9 telecommunications carrier with access to call-
10 related databases in a manner that complies with
11 section 222 of the Act.

12 (3) Service Management Systems:

13 (A) A service management system is defined as a
14 computer database or system not part of the
15 public switched network that, among other things:

16 (1) Interconnects to the service control point
17 and sends to that service control point the
18 information and call processing
19 instructions needed for a network switch to
20 process and complete a telephone call;
21 and

22 (2) Provides telecommunications carriers with
23 the capability of entering and storing data
24 regarding the processing and completing
25 of a telephone call.

26 (B) An incumbent LEC shall provide a requesting
27 telecommunications carrier with the information
28 necessary to enter correctly, or format for entry,
29 the information relevant for input into the
30 incumbent LEC's service management system.

31 (C) An incumbent LEC shall provide a requesting
32 telecommunications carrier the same access to
33 design, create, test, and deploy Advanced
34 Intelligent Network-based services at the service

**PANEL TESTIMONY OF VERIZON - MASSACHUSETTS ON
COSTS AND RATES FOR UNBUNDLED NETWORK
ELEMENTS AND RELATED WHOLESALE SERVICES**

1 management system, through a service creation
2 environment, that the incumbent LEC provides to
3 itself.

4 (D) An incumbent LEC shall provide a requesting
5 telecommunications carrier access to service
6 management systems in a manner that complies
7 with section 222 of the Act.

8 **A. SCOPE**

9 Q. What is the scope of the studies presented here by Verizon MA
10 concerning this element?

11 A. As explained above, the studies of this element that are presented
12 here are limited to the signaling network elements, including STP Port
13 and Signaling links, access to certain databases, and Service
14 Management System.

15 **B. ELEMENT DESCRIPTION**

16 Q. Please define the signaling network elements used in Verizon MA's
17 forward-looking incremental cost study.

18 A. Modern telecommunications networks transmit signaling information
19 over communication paths separate from those used to transmit the
20 voice communication itself. Signaling information is switched at
21 Signaling Transfer Points ("STPs"), and is carried between STPs and
22 local and tandem switches over signaling links. Routing and other
23 information used by the signaling network are stored in call-related

COSTS AND RATES FOR UNBUNDLED NETWORK
ELEMENTS AND RELATED WHOLESALE SERVICES**

1 databases known as Intelligent Service Control Points ("ISCPs"). The
2 protocol used for signaling information is known as Signaling System
3 7 ("SS7"). A call-related database query is a switch query and
4 database response through the signaling network, which provides
5 access to Verizon MA's Line Information Database ("LIDB") and Toll
6 Free Calling ("800") database by means of physical access at the
7 STP.

8 **C. STP PORT AND SIGNALING LINK**

9 Q. Please describe the forward-looking construct used to develop the
10 costs associated with the STP port for A-link traffic.

11 A. A representative model STP was determined by reviewing the actual
12 STP network, number of ports, and the number of SS7 links. A
13 forward-looking representative switch, based on the latest available
14 STP technology, was designed. The forward-looking model office
15 was used as the basis for determining the investments associated
16 with the STP port element.

17 Q. Please describe the cost methodology used in developing the STP
18 port element and signaling link element.

**PANEL TESTIMONY OF VERIZON - MASSACHUSETTS ON
COSTS AND RATES FOR UNBUNDLED NETWORK
ELEMENTS AND RELATED WHOLESALE SERVICES**

1 A. The cost methodology used in developing the STP port cost is
2 consistent with the cost methodology for switching described
3 previously.

4 Q. Did the Company deaverage the STP port element?

5 A. No. Since the signaling network provides signaling for calls between
6 two (or more) density zones, it would not be meaningful to develop
7 deaveraged STP port costs.

8 Q. How were the material investments for the STP port developed?

9 A. The material investments for the STP were developed using
10 Telcordia's Common Channel Signaling Cost Information System
11 ("CCSCIS"), in the same manner as described for Local Switching for
12 the SCIS. The latest negotiated vendor discount was applied to the
13 material investment in CCSCIS.

14 Q. What version of CCSCIS was used for Verizon MA's study?

15 A. The latest available version from Telcordia, Version 5.0.4.

16 Q. Please describe how the investment for the signaling link investment
17 was developed.

18 A. The investment of the Signaling Link element was developed by
19 taking the investments and the associated costs previously developed
20 for the Dedicated Transport "fixed" and "mileage" elements at the
